

# SUPPORTING CLIMBING AND TALL PLANTS

If you are growing any climbing plants such as peas, beans, cucumbers or squashes, you will need to support these with a frame of some sort. Below are two examples of easy cost-effective frames made with bamboo and string. You can also use fallen branches of trees.

A-Frame

Wig Wam

## CLOCHES

Cloches are great for protecting young seedlings/ plants from frost and wind if you want to get planting early on or carry on later on in the season. They also shield your plants from pests such as squirrels and foxes.

## BRASSICA COLLARS

Made from roofing felt, these stop cabbage white butterflies from laying eggs at the base of your brassicas.
